Study of the mechanisms of ventilation of the alveolar compartment of dolphins, ensuring adaptation of the respiratory system to conditions of high motor activity in the water medium, has long attracted the attention of researchers (A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z, AA, AB, AC, AD, AE, AF, AG, AH, AI, AJ, AK, AL, AM, AN, AO, AP, AQ, AR, AS, AT, AU, AV, AW, AX, AY, AZ, BA, BB, BC, BD, BE, BF, BG, BH, BI, BJ, BK, BL, BM, BN, BO, BP, BQ, BR, BS, BT, BU, BV, BW, BX, BY, BZ, CA, CB, CC, CD, CE, CF, CG, CH, CI, CJ, CK, CL, CM, CN, CO, CP, CQ, CR, CS, CT, CU, CV, CW, CX, CY, CZ, DA, DB, DC, DD, DE, DF, DG, DH, DI, DJ, DK, DL, DM, DN, DO, DP, DQ, DR, DS, DT, DU, DV, DW, DX, DY, DZ, EA, EB, EC, ED, EE, EF, EG, EH, EI, EJ, EK, EL, EM, EN, EO, EP, EQ, ER, ES, ET, EU, EV, EW, EX, EY, EZ, FA, FB, FC, FD, FE, FF, FG, FH, FI, FJ, FK, FL, FM, FN, FO, FP, FQ, FR, FS, FT, FU, FV, FW, FX, FY, FZ, GA, GB, GC, GD, GE, GF, GG, GH, GI, GJ, GK, GL, GM, GN, GO, GP, GQ, GR, GS, GT, GU, GV, GW, GX, GY, GZ, HA, HB, HC, HD, HE, HF, HG, HH, HI, HJ, HK, HL, HM, HN, HO, HP, HQ, HR, HS, HT, HU, HV, HW, HX, HY, HZ, IA, IB, IC, ID, IE, IF, IG, IH, II, IJ, IK, IL, IM, IN, IO, IP, IQ, IR, IS, IT, IU, IV, IW, IX, IY, IZ, JA, JB, JC, JD, JE, JF, JG, JH, JI, JJ, JK, JL, JM, JN, JO, JP, JQ, JR, JS, JT, JU, JV, JW, JX, JY, JZ, KA, KB, KC, KD, KE, KF, KG, KH, KI, KJ, KK, KL, KM, KN, KO, KP, KQ, KR, KS, KT, KU, KV, KW, KX, KY, KZ, LA, LB, LC, LD, LE, LF, LG, LH, LI, LJ, LK, LL, LM, LN, LO, LP, LQ, LR, LS, LT, LU, LV, LW, LX, LY, LZ, MA, MB, MC, MD, ME, MF, MG, MH, MI, MJ, MK, ML, MM, MN, MO, MP, MQ, MR, MS, MT, MU, MV, MW, MX, MY, MZ, NA, NB, NC, ND, NE, NF, NG, NH, NI, NJ, NK, NL, NM, NN, NO, NP, NQ, NR, NS, NT, NU, NV, NW, NX, NY, NZ, OA, OB, OC, OD, OE, OF, OG, OH, OI, OJ, OK, OL, OM, ON, OO, OP, OQ, OR, OS, OT, OU, OV, OW, OX, OY, OZ, PA, PB, PC, PD, PE, PF, PG, PH, PI, PJ, PK, PL, PM, PN, PO, PP, PQ, PR, PS, PT, PU, PV, PW, PX, PY, PZ, QA, QB, QC, QD, QE, QF, QG, QH, QI, QJ, QK, QL, QM, QN, QO, QP, QQ, QR, QS, QT, QU, QV, QW, QX, QY, QZ, RA, RB, RC, RD, RE, RF, RG, RH, RI, RJ, RK, RL, RM, RN, RO, RP, RQ, RR, RS, RT, RU, RV, RW, RX, RY, RZ, SA, SB, SC, SD, SE, SF, SG, SH, SI, SJ, SK, SL, SM, SN, SO, SP, SQ, SR, SS, ST, SU, SV, SW, SX, SY, SZ, TA, TB, TC, TD, TE, TF, TG, TH, TI, TJ, TK, TL, TM, TN, TO, TP, TQ, TR, TS, TT, TU, TV, TW, TX, TY, TZ, UA, UB, UC, UD, UE, UF, UG, UH, UI, UJ, UK, UL, UM, UN, UO, UP, UQ, UR, US, UT, UY, UZ, VA, VB, VC, VD, VE, VF, VG, VH, VI, VJ, VK, VL, VM, VN, VO, VP, VQ, VR, VS, VT, VU, VV, VW, VX, VY, VZ, WA, WB, WC, WD, WE, WF, WG, WH, WI, WJ, WK, WL, WM, WN, WO, WP, WQ, WR, WS, WT, WU, WV, WW, WX, WY, WZ, XA, XB, XC, XD, XE, XF, XG, XH, XI, XJ, XK, XL, XM, XN, XO, XP, XQ, XR, XS, XT, XU, XV, XW, XX, XY, XZ, YA, YB, YC, YD, YE, YF, YG, YH, YI, YJ, YK, YL, YM, YN, YO, YP, YQ, YR, YS, YT, YU, YV, YW, YX, YY, YZ, ZA, ZB, ZC, ZD, ZE, ZF, ZG, ZH, ZI, ZJ, ZK, ZL, ZM, ZN, ZO, ZP, ZQ, ZR, ZS, ZT, ZU, ZV, ZW, ZX, ZY, ZZ).

This investigation, made under the direction of Doctor of Medical Sciences A. Z. Solchinskaya, had as its objective a clarification of some aspects of this problem. In particular, a study was made of the changes in gas exchange, alveolar ventilation, and some indices of hemodynamics in bottle-nodded porpoises (during breathing) during the breathing of hypoxic mixture containing 11.7% O<sub>2</sub> in nitrogen. The investigations were made using seven healthy bottle-nodded porpoises weighing from 135 to 270 kg adapted to people and the experimental conditions. During the investigation the animals were in a motionless state on a soft surface in sea water (at a temperature of 22-23°C); this ensured a minimum of energy expenditure in relation to the indicated position. Oxygen consumption was determined by the open method devised by DeGassis and Holden. The samples of alveolar air were selected using an automatic device. Alveolar ventilation was computed by the Bohr method. The minute volume of circulation (MVC) was determined by the acetylene method as devised by Grahman-Tarlin-Moranov under normal conditions during the fifth minute of breathing of a hypoxic mixture. After conducting the necessary measurements when breathing atmospheric air (P<sub>O<sub>2</sub></sub> = 159 mm Hg) the animals were

"On the Problem of Arranging Elements of Different Overall Dimensions"

V sb. Avtomatika i vychisl. tekhn. (Automation and Computer Technology-- collection of works), No 3, Vil'nyus, "Mintis", 1971, pp 211-218 (from RZh-Kibernetika, No 12, Dec 71, Abstract No 12V886)

Translation: Mathematical formulation of the problem of arranging elements of different overall dimensions with the aid of R-functions is considered. An algorithm is proposed for digital computer solution of this problem. The possibilities of solving this problem by sequences of heuristic methods are discussed. Authors' abstract.

ABSTRACT. DEVELOPMENT OF PROCEDURES FOR  
CONSTRUCTING FUNDAMENTAL MATRICES IN SOLVING THE BOUNDARY VALUE PROBLEM  
OF A B-PARABOLIC SYSTEM OF EQUATIONS IN A 1-4 SPACE WITH A BESSEL  
OPERATOR. A RELATION IS ESTABLISHED BETWEEN THESE FUNDAMENTAL MATRICES  
AND THOSE OF CORRESPONDING B ELLIPTICAL SYSTEMS. SEVERAL PERTINENT  
THEOREMS ARE FORMULATED AND PROVED IN THE PROCESS. FACILITY:  
CHERNIVETS'KII DERZHAVNII UNIVERSITET, CHERNOVTSY, UKRAINIAN SSR.

"Puncher Mechanism"

USSR Author's Certificate No. 267191, Filed 3/08/67, Published 3/08/70 (Translated from Referativnyy Zhurnal Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No. 4, 1971, Abstract No. 4B470P).

Translation: The mechanism suggested contains a cam drive with an intermediate dog to impart forward and rotary motion to a die and differs in that in order to increase the speed and reliability of punching, rollers contact the forward and return cams, which drive the punches through rocker arms. 1 fig.

244200 DIESEL DRIVEN HAMMER consists of tubular  
body 1 with hammering piston 8. It is  
distinguished by connecting the piston cavity to  
the receiver 2, through a pipe, which is connected  
by means of springed arm 9 regulating the valve  
which acts on the pneumatic cylinder piston-rod  
11. Cooling unit 4 is placed on the pipe connect-  
ing the receiver to the hammer cavity.

"Inhibitory Effect of Homologous Ribonucleic Acid on the Growth  
of Spontaneous Tumors in Mice of the High-Cancer A and C<sub>3</sub>H Lines"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya  
Terapiya, No 1, 1971, pp 45-47

Abstract: Deproteinized RNA from mice of the low-cancer C<sub>57</sub>B1  
line was injected subcutaneously into A and C<sub>3</sub>H mice with  
palpable mammary tumors. The antitumor effect of the preparation  
was assessed from the differences in the weight of tumors in  
control and experimental mice (the tumors were systematically  
weighed in animals sacrificed 10, 20, 30, 40, 80, and 100 days  
after the injection) and in the survival time of animals. Where-  
as the weight of tumors in control mice increased rapidly for  
the first 1 to 1-1/2 months and remained stable thereafter, it  
was significantly lower (50 to 77%) in the experimental group at  
1/2

all stages, especially during the first 2 months. The survival time of experimental animals was also markedly longer than that of controls. Injection of the RNA had no toxic effects, judging by the fact that the body weight of experimental and control animals was virtually the same at the end of the experiment.

**BROWNIAN MOTION NEAR THE CRITICAL POINT  
OF THE TWO-PHASE LIQUID-LIQUID EQUILIBRIUM**

V. G. Martynets, E. V. Malin

Brownian movement of 0.23 micron mean radius particles near the critical mixing point is studied by dark-field microphotography. For a methanol-cyclohexane system the Brownian particle diffusion coefficient decreases by two times when the temperature approaches the critical point from the homogeneous region. The change of the system viscosity in the critical region is calculated. The results are discussed.

"Study of the Stereochemistry of the Alkaloids of Codonopsis and Codonopsinin by the Method of Nuclear Magnetic Resonance Spectroscopy"

Tashkent, Khimiya Prirodnikh Soyedineniy, No 4, 1972, pp 495-498

Abstract: A structure was proposed previously for the new alkaloids -- codonopsin (I) and codonopsinin (II) isolated from *Codonopsis eleatidea* on the basis of chemical transformations and spectral data (S. F. Matkhalikova, et al., KhPS, 30, 1969; S. F. Matkhalikova, et al., KhPS, 210, 1971). A study has now been made of the nuclear magnetic resonance spectra of the bases and their acetyl derivatives in order to establish the spatial structure of these alkaloids. The N-methylpyrrolidine ring A has a semiconformation with relative reciprocal arrangement and orientation of the protons and H<sub>1</sub> and H<sub>3</sub> -  $\alpha$  groups pseudoaxial, H<sub>2</sub> and Ph- $\beta$  equatorial, and C-CH<sub>3</sub>- $\beta$  pseudoaxial, OR<sub>1</sub>- $\alpha$  pseudoaxial, OR<sub>2</sub>- $\beta$  pseudoaxial and H<sub>4</sub>- $\alpha'$  pseudoaxial.

"Changes in the EPR Spectra of the Mouse Liver Upon Poisoning With Boric Acid and Carbon Tetrachloride"

Moscow, Biofizika, Vol 16, No 3, May/June 71, pp 472-475

Abstract: It had been established in earlier work by the authors (Biofizika, Vol 15, p 547, 1970) that following poisoning of mice with elemental B, preparations from the liver of the animals showed a pronounced drop in the intensity of the EPR signal associated with complexes of hemin Fe that are located in the microsome respiration chain. Similar changes on poisoning with boric acid were not observed, because this substance had been eliminated from the organism at the time when the EPR spectrum was determined. It was found in the present investigation that changes in the EPR spectrum similar to those resulting from poisoning with B and observed several days later developed 2-6 hrs after administration of boric acid. The intensity of the EPR signal corresponding to the non-heme Fe complex located in the mitochondria was also lowered, but the principal effect was on the hemin-Fe complex. The effect on

- 2 -

USSR

VANIN, A. F., et al., Biofizika, Vol 16, No 3, May/June 71, pp 472-475

the EPR spectrum, which was determined on liver samples at 77°K, was unspecific; it was also observed after poisoning of the animals with CCl<sub>4</sub>. Besides the reduction of the intensity of EPR signals corresponding to heme and non-heme Fe complexes after poisoning, new signals developed in the spectrum which could be ascribed to nitrosyl complexes of heme and non-heme Fe on the basis of available data on the EPR spectra of these complexes.

"Cold Resistance of Joints Welded at Negative Temperatures"

Moscow, Svarochnoye proizvodstvo, No 9, 1972, pp 26-28

Abstract: A study was made of the effect of negative temperatures during welding on the cold resistance of welded joints of St.3sp and 10G2S1 steel. The results of a chemical analysis and mechanical testing of the steel are tabulated. The threshold of cold brittleness defined by the minimum impact toughness is somewhat lower than that defined by the presence of a 20% viscous component in the fracture. When welding the investigated steel, the maximum reduction in impact toughness takes place in the zone heated to 200-300° C. With a decrease in the initial welding temperature to -30° C, an increase in the threshold of cold brittleness of the metal in the weld-affected zone by 25-35° C takes place by comparison with the cold brittleness threshold of the base metal. Negative temperatures during welding especially affect the cold brittleness of the weld-affected zone of low-carbon St.3sp steel.

"Study of the Efficiency of Welded Joints Between Dissimilar Steels (12Kh1MF  
and Kh5ML) in a Medium of Hydrogen"

Moscow, Khimicheskoye i Neftyanoye Mashinostroyeniye, No 11, Nov 70, pp 25-27

Abstract: This article presents the results of an investigation of the effects of hydrogen on the metal in the area of a welded joint between 12Kh1MF and Kh5ML steels. The investigations were performed using specimens which were held in an autoclave at 570°C under a hydrostatic pressure of technical hydrogen from 100 to 300 kg/cm<sup>2</sup>. The temperature used in the experiments was 570 ± 10°C. The experiments showed that whereas holding under a 90 kg/cm<sup>2</sup> hydrogen pressure at 570°C for various times up to 4,000 hours had little effect on mechanical properties, holding at 273 kg/cm<sup>2</sup> hydrogen pressure resulted in the development of a tendency to brittle rupture, primarily along the line of the welded seam. Notch-sensitivity of the metal was increased in all cases. No noticeable changes in the structure of the metal were discovered. However, in all cases the exposure to hydrogen resulted in slight surface decarburization along the seam.

"Application of Maleic Acid Hydrazide for Retarding the Sprouting of Sugar  
Beet Roots and Lowering the Sugar Losses in Storage"

Moscow, Khimiya v sel'skom khozyaystve, No 11, 1972, pp 57-60

Abstract: A study was made to determine the optimal concentration of maleic acid hydrazide and study its effects on the sugar beet root harvest, the dynamics of the sugar content in the roots and the weight losses in storage. A phytopathological evaluation of the root crops after storage in pits was also made. Spraying the sugar beet plants 20 to 30 days before gathering the harvest with a 0.6% aqueous solution of maleic acid hydrazide with the addition of OP-10 wetting agent promotes an increase in the sugar content of the roots and a decrease in their sprouting during prolonged storage. The roots of the maleic acid hydrazide treated plants store better in pits than the control roots (lower sugar and weight losses), and they are less subject to rotting.

Translation:

Annotation

The collection presented experimental data and clinical material on the protective properties and mechanism of action of amidine compounds during hyperoxia and hypoxia as well as on the effect of these substances on physical fitness, the cardiovascular system, and uterus. The review articles on ephedrine and gutimine provide a fairly complete idea of the nature of this new and highly promising group of drugs.

The collection is of interest to pharmacologists, pathophysiologists, physiologists, surgeons, anesthesiologists, obstetricians and gynecologists, and sports physicians.

"The Antihypoxic Activity of Cobalt Dioximines"

Kishinev, Izvestiya Akademii Nauk Moldavskoy SSR, Seriya Biologicheskikh i Khimicheskikh Nauk, No 5, 1971, pp 88-89

Abstract: The effects were studied of some Co dioximines (diaquodioximine, dipyridinedioximine, dinicotinamidedioximine),  $\text{CoCl}_2$ ,  $\text{CoNa}_2\text{EDTA}$ , and cyanocobalamin on mice that had been subjected for 30 min to the effect of CO in the concentration  $\text{CL}_{99} = 15 \text{ mg/l}$ . The Co compounds were administered intraperitoneally 20 min before exposure to CO. The cobalt dioximines were less toxic than  $\text{CoCl}_2$  or  $\text{CoNa}_2\text{EDTA}$ . Of the dioximines, Co diaquodioximine (100 mg/kg) had the highest activity in preventing the death of mice as a result of hypoxia produced by carbon monoxide (rate of survival 30%) and in prolonging the length of life (by an average time of 15.0 min) of the nonsurvivors.

"The Pathophysiology of Experimental Botulism"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, no 3, 1971, pp 16-19

Abstract: A study was carried out of the disturbance of external respiration, gas content and acid-base state of blood, and of hemodynamic shifts with severe experimental intoxication with botulinus toxin. Fifty dogs were intoxicated with type A botulinus toxin. At the time of administration and at the peak of intoxication, the gas content of arterial and venous blood, hemoglobin, hematocrit, specific weight of blood and plasma, and content of sodium, potassium, lactic and pyruvic acid were determined. External respiration was studied by means of a type T35 spirometabolograph and circulation by the modified mechanical cardiographic method. Biocurrents of the cerebral cortex were recorded on a four-channel electroencephalograph. At the peak of

1/2

USSR

MATKOVSKIY, V. S., et al, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, No 3, 1971, pp 16-19

intoxication, a reduction of per minute respiration with a resulting lowered level of oxyhemoglobin in arterial blood, and respiratory acidosis were noted. EKG data revealed predominantly hypoxic shifts in the myocardium, and the EEG data -- inhibitory processes in the cerebral cortex. Intensified cardiac activity served as a compensatory mechanism for respiratory insufficiency. The secondary shifts in the function of organs and systems in connection with disturbances of a metabolic and functional nature played a vital role in the pathogenesis of botulinus intoxication. Morphological shifts in the CNS were apparently caused largely by disturbances in the microcirculation and were reversible. In treating severe botulinus intoxication, special attention should be paid to timely correction of external respiratory insufficiency, with artificial ventilation of lungs most expedient.

"New Data on the Spread of "Far Eastern" Scarletina-Like Fever (Pseudotuberculosis)  
in the RSFSR"

Moscow, Sovetskaya Meditsina, Vol 33, No 7, Jul 70, pp 132-135

Abstract: "Far Eastern" scarlatina-like fever is a new infectious disease which was detected in 1957 and identified as a special form of pseudotuberculosis in 1965. The pathogen, Pasteurella pseudotuberculosis Pfeifferi, is transmitted by certain rodents and is contracted by human beings through the gastrointestinal tract. For a long time it was believed that this disease was restricted to the Far East. In February and March 1969, a mass outbreak occurred in several Leningrad kindergartens, involving 78 children aged 4 to 7, as well as eight adult staff members. Because of the diverse symptoms, the illness was variously diagnosed as scarlet fever, tonsillitis, influenza, german measles, and, in one case appendicitis. Since conventional treatment was ineffective, comprehensive epidemiological, clinical, and laboratory investigations were performed, and the disease was finally diagnosed as pseudotuberculosis. The source of the infection was rapidly tracked down. All of the kindergartens affected regularly served raw vegetables purchased

from the same seller. The storage facilities were inspected and rodents found there were subjected to laboratory tests in which *Pasteurella pseudotuberculosis* was isolated. Since the disease is no longer restricted to the Near East, physicians are urged to be on the alert for it when they observe atypical cases of scarlet fever, German measles, acute appendicitis, or hepatitis.

"The Influence of Intense Mental Work During the Day and Night Hours on the  
Excretion of Catecholamines in the Urine"

Leningrad, Fiziologicheskii Zhurnal SSSR imeni I. M. Sechenov, Vol 59, No 3,  
Aug 73, pp 1,151-1,157

Abstract: The excretion of catecholamines in the urine was studied for 68  
railway employees who alternated day and night shifts. In the daytime,  
operators and on-duty men exhibited only a decrease in the reserve capacities  
of the sympatho-adrenalin system, while dispatchers, said to do more intense  
work, also showed an increase in noradrenalin excretion. During the night  
shift the dispatchers showed a larger increase in adrenalin excretion than  
other railway workers, though less than a control group not accustomed to  
night work, and a larger increase in noradrenalin excretion than either group.  
Dispatchers also increased their excretion of the dihydroxyphenylalanine

1/2

precursor. The operators and on-duty men showed a larger increase in nor-adrenalin excretion during the night work than the controls. Excretion levels returned to the initial on the second day of rest. These results are said to show that even after many years of adaptation to a certain type of neuro-emotional work the excretion of catecholamines still depends on the intensity of the work, and that adaptation to night work is more difficult than to day work.

"Catecholamines in the Heart During Stress Reactions"

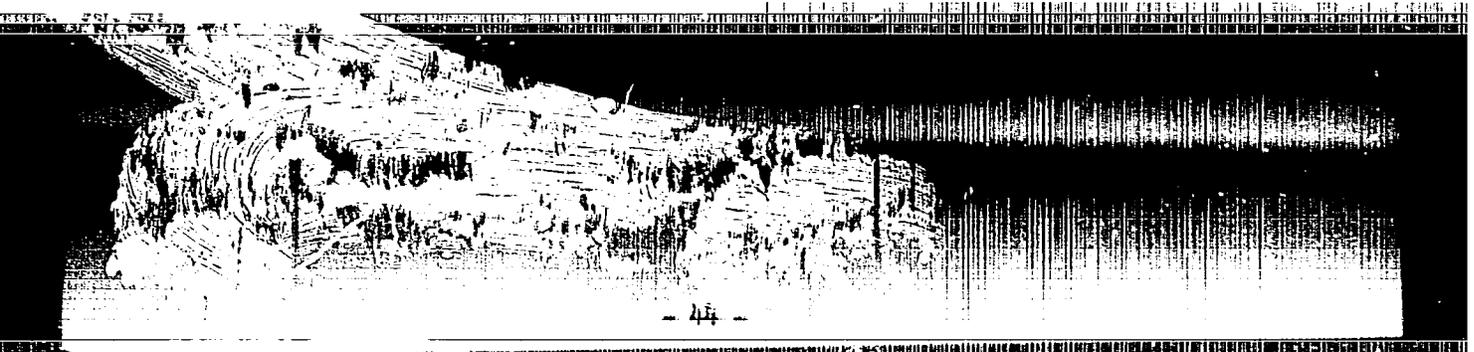

Moscow, Kardiologiya, Vol 13, No 1, 1973, pp 140-152

Abstract: Domestic and foreign literature is reviewed regarding the function, concentration, and synthesis of catecholamines in the heart muscle. Nor-adrenalin is the most abundant catecholamine in the mammal heart and adrenalin accounts for only 25-35%. There is a definite relation between functions of the heart and adrenal glands with respect to catecholamine metabolism during stress reactions. In the presence of stress the heart muscle is capable of concentrating adrenalin from the blood immediately after the application of stress; all succeeding phase changes in the accumulation of adrenalin depend on the specificity of stresses. When resources of adrenalin in the adrenal glands are exhausted the heart muscle can probably synthesize it. Experiments with guinea pigs showed that accumulation of adrenalin in the heart muscle after the application of stress secures activation of metabolic processes and

"The Pathophysiology of Experimental Botulism"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya, No 3, 1971,  
pp 16-19

Abstract: A study was carried out of the disturbance of external respiration,  
gas content and acid-base state of blood, and of hemodynamic shifts with  
severe experimental intoxication with botulinus toxin. Fifty dogs were into-  
xicated with type A botulinus toxin. At the time of administration and at the  
peak of intoxication, the gas content of arterial and venous blood, hemoglobin,  
hematocrit, specific weight of blood and plasma, and content of sodium, potas-  
sium, lactic and pyruvic acid were determined. External respiration was  
studied by means of a type T35 spirometabolograph and circulation by the  
modified mechanical cardiographic method. Biocurrents of the cerebral cortex  
were recorded on a four-channel electroencephalograph. At the peak of

"Excretion of Catecholamines and Their Precursors in Night and Day Workers"

Leningrad, Fiziologicheskii Zhurnal SSSR, No 7, 1971, pp 1,027-1,031

Abstract: Study of the activity of the sympathicoadrenal system in railroad employees working a succession of night and day shifts. The amount of epinephrine and (E) and norepinephrine (NE) on a work day was found to be the same as on a rest day, but there was an increase in the ratio of E, NE, DA (dopamine) to D (dopa) that did not return to normal on the first day of rest. There was an increase in the excretion of NE and increase in the ratio of E and NE to DA and decrease in the ratio of E, NE, and DA to D the night after day work compared with night rest. In general, on the day of rest the amount of catecholamines secreted by the shift workers was lower than that excreted by the control. The blood cholesterol level was higher during a work day than on a rest day.

ADRENALIN, NORADRENALIN AND THEIR PREDECESSOR  
EXCRETION (DOPA AND DOPAMIN) IN PATIENTS WITH MIGRAINE

*N. B. Goldman, E. S. Mattina and A. N. Fets*

The authors conducted an investigation of 25 patients with migraine, where they studied the diurnal urine excretion (as well as in partial excretion of urine) of adrenaline, noradrenalin, dopamin and dopa in the intercrises period, during crises, as well as during the introduction of insulin. It was possible to show that in the intercrises period the excretion of these substances did not disclose significant differences compared to normals. It was demonstrated that there was only a decrease in the noradrenalin--adrenalin excretion ratio. In the period prior to a crisis there was a decrease in adrenalin excretion. In the crucial period of the crisis adrenalin excretion rose significantly. In those cases where during the introduction of insulin a migrainous attack ensued there was an increased adrenalin excretion which exceeded the changes seen in normals. The achieved results give ground to assume that the changed adrenalin content plays a certain role in the development of a migrainous attack.

THE INFLUENCE OF AMINAZINE ON ADRENALINE, NORADRENALINE, DOPAMINE AND DOPA EXCRETION IN NORMALS AND IN THE MANIC PHASE OF THE MANIC-DEPRESSIVE PSYCHOSIS

E. Sh. Mal'ina, M. S. Osipova

The authors studied the influence of aminazine (50 mg in injections) on the adrenaline, noradrenaline, dopamine and DOPA urine excretion in normals and in patients in the manic phase of the manic-depressive psychosis. The urine was collected during 24 hours in separate portions. It was demonstrated that after 3 hours after the introduction of aminazine there was an increase in the excretion of adrenaline, dopamine and DOPA and a drop in the excretion of noradrenaline in normals. These changes can be conditioned by the activation of

1/2

REEL/F  
FRAME  
**19680628**

2

AP0029117

the cortical layer of the suprarenals as well as by the inhibition of related noradrenaline from the adrenergic granules and an absorption of it by the circulating blood. The authors assume that aminazine may directly influence the stimulation of catecholamine biosynthesis. In granules with a manic phase of the manic-depressive psychosis the influence of aminazine on the excretion of adrenergic substances is expressed later: in 9 hours after the introduction of aminazine and may be expressed in the increase of adrenaline, noradrenaline and DOPA excretion. They assume that aminazine in such cases does not arrest noradrenaline in the adrenergic granules.

"Sympathoadrenal System in Patients With Vibration Sickness"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 10, 1971, pp 12-16

Abstract: Analysis of the excretion with urine of epinephrine, norepinephrine, dopa, and dopamine in 50 patients with vibration sickness at rest and after functional tests (immersion of hands in cold water and subcutaneous injection of insulin) was performed. The excretion of norepinephrine was lower in the patients than in healthy controls, and the daily rhythm of catecholamine excretion was impaired, as shown by a marked decrease at night. In response to cold, only the excretion of norepinephrine increased in the patients, whereas both norepinephrine and epinephrine increased in the control. The injection of insulin decreased the excretion of epinephrine, norepinephrine, dopamine, and dopa in the patients (i.e., it depressed the sympathoadrenal system) but increased that of epinephrine without affecting the other mediators.

"Study of Corrosion Resistance of Chemical Nickel Coatings in Chlorine"

Moscow, Zashchita Metallov, Vol 8, No 3, May-Jun 72, pp 367-369

Abstract: The author studied the possibility of using chemical nickel-plating for protecting carbon steel against the corrosive action of dry (moisture content less than 0.02 percent) and moist chlorine. Specimens of St.3 carbon steel (size 35 x 15 x 1 mm), after degreasing with a magnesium oxide paste and etching in hydrochloric acid (1 : 1) 0.5-1 min, at room temperature, were nickel-plated in a solution with pH 4.8-5.2 containing (g/l): nickel sulfate 21, sodium hypophosphite 24, sodium acetate 10, malic anhydride 1.5 at a temperature of 87-92°. The coating was carried out with continuous filtration and periodic adjustment of solution. The thickness of the coating was determined by weighing, porosity according to GOST [All-Union State Standard] 3247-46. Nickel-plating was followed by heat treatment at 400° for an hour in an argon atmosphere. The devised nickel-plating method has been introduced at the Leningrad Compressor Plant. Laboratory studies of nickel coatings

"Determination of Redox Potentials of Electron Exchange Polymers With a Conjugation System"

Moscow, Vysokomolekulyarnyye Soyedineniya, Vol 13, No 5, May 71, pp 1170-1175

Abstract: An equilibrium method for determining redox potentials of insoluble, slightly swelling compounds (those unstable towards oxidizing agents, as well as compounds with low redox potentials) has been developed. The method is based on the calculation of the potential of a redox pair in equilibrium with the studied system. When two redox systems interact, an equilibrium will set up between them after some time, when  $E_1 = E_2$ . From the Nernst equation and above condition the formula was developed for calculation of the unknown  $E_o^2$

$$E_{o2} = E_{o1} + \left[ \frac{RT}{F} \ln \left( \frac{[O_1]}{[R_1]} \right)^{1/n_1} \left( \frac{[R_2]}{[O_2]} \right)^{1/n_2} \right]$$

1/2

HOME REMAINS CONCERNING PERIODIC PHYSICAL EXAMINATIONS

Article by V.P. Azarkov, I.P. Grigor'ev, P.G. Matochkin; Moscow, Sovetskoye Zdravookhraneniye, Russia, No 7, 1971, submitted 23 February 1971, pp 25-28

Progress of socialist economies is inseparably linked with the productivity of labor. The economic indices of rise in productivity of labor are made up of a set of factors which determine the expediency and profitability of each unit of working time in industry.

In this regard, we should like to voice some views about periodic physical examination of industrial workers which is done in accordance with order No 400 dated 30 May 1969, issued by the USSR Minister of Health which supersedes order No 176 dated 7 September 1957). In our opinion, there should be a revision of the justification of such physicals from the economic point of view. It is also important to discuss the effectiveness of their purpose.

Since 1954, our therapeutic institution has been performing physicals on industrial workers. Over 7,000 people are subject to regular examinations. Before the start of a new year annual charts are prepared which are approved by enterprise directors and therapeutic institution administrators. These charts are prepared by the heads of polyliners, of industrial physicians, and chief engineers of enterprises. In the course of making preparations for the examinations, the charts must be coordinated with the plant trade union committees.

The medical commission consisted of a shop therapist, specialist physicians, nurses and laboratory technicians. Physicians are called upon only in the special fields in which pathology is anticipated and whose participation in the physical examination is stipulated in the order of the local Ministry of Health. As a rule, the specialists are experienced in the care of industrial workers, they are well acquainted with their working conditions and occupational hazards, and they are also on the staff of plant polyliners or the service the enterprises attached to them.

Before starting the physical examinations, instructions are issued published for the purpose of discussion -- either.

"Diffusion of a Magnetic Field in a Conductor Moving According to the Rule  $v \sim 1/r$ "

7-ye Soveshch. po Magnit. Gidrodinamike. T. 1 [Seventh Conference on Magnetic Hydrodynamics, Vol 1], Riga, Zinatnye Press, 1972, pp 218-220, (Translated from Referativnyy Zhurnal, Mekhanika, No 11, 1972, Abstract No 11 B3 by I. M. Rutkevich).

Translation: Self-similar analytic solutions are produced for several axisymmetrical problems concerning the diffusion of a magnetic field in a moving, radially cylindrical conductor with constant conductivity  $\sigma$ . The problem is solved in the magnetohydrodynamic approximation, when the shift currents can be ignored. The field of velocities is assumed to be the same as in the case of flow from a point source or sink in an incompressible fluid:  $v = q/2\pi r$ . The distribution of the magnetic field depends on the self-similar variable  $x = \pi r^2/qt$  and the dimensionless parameter  $\mu = \sigma q/c^2$ , equal to half the magnetic Reynolds number.

A solution is given for the problem of diffusion of an initially homogeneous magnetic field  $B_0$  into an expanding cavity, formed upon compression

of a conductor from the axis. Constant field  $B_*$  is formed in the cavity, which approaches  $B_0$  as  $\mu \rightarrow 0$  and 0 as  $\mu \rightarrow \infty$ . Then, the problem of expansion of a conducting cylinder in constant external field  $B_0$  is studied. Where  $\mu \gg 1$ , the field within the conductor is concentrated in the surface layer of thickness  $\delta r \sim \delta_{sc}/\sqrt{\mu}$ , where  $\delta_{sc}$  is the thickness of the skin layer in the nonmoving medium. If the conductor expands, forming a cavity within itself, and there is no field in it at infinity, the magnetic fluxes in the conductor and cavity remain unchanged. In conclusion, a solution is presented for a cavity compressed to the axis. The field within the cavity increases without limit as it collapses, while the magnetic flux losses increase with increasing parameter  $\mu$ .

"Explosion Shock Tube"

Moscow, Teplofizika Vysokikh Temperatur, Vol 10, No 6, Nov-Dec, pp 1230-1284

Abstract: Experiments were carried out on a model of explosion shock tube. A stream of dense air plasma with a velocity of 25-100 km/sec was obtained by means of an explosive gas compressor. Photographing of the model was carried out under conditions when the stream behind the front of the shock wave became nontransparent. The experiments were carried out in a laboratory explosion chamber.

"Pathomorphological and Some Biochemical Shifts in the Organism During Intoxication With Manganese Ethylenebis (dithiocarbamate) (Maneb)"

Kiev, Vrachebnoye Delo, No 8, 1971, pp 132-136

Abstract: Structural and some biochemical shifts in the organism after exposure to maneb were investigated. The activity of ceruloplasmin, SH-group content, and pyruvic acid level were determined in cats and rats. Experiments showed that single administration of maneb per os in the maximum permissible dose (1,200 mg/kg of body weight) induces cerebral circulatory disorders in the form of moderate venous plethora, pericellular and perivascular edema. Signs of protein dystrophy were detected in the parenchymatous organs, especially in the liver. When maneb was given several times per os in a dose of 1/10 LD<sub>50</sub> (300 mg/kg), the nature and direction of pathomorphological changes in the experimental animals was the same as for the single-administration of this pesticide in the maximum permissible dose. However some organs, for example the brain, showed grosser morphological changes. Upon multiple daily administration for four months of 1/20 LD<sub>50</sub> of the agent, similar changes were noted in the organs of experimental animals, though they were weaker and less

1/2

USSR

RAPPOPORT, M. B., and MATOKHNYUK, L. A., Vrachebnoye Delo, No 8, 1971, pp 132-136

widespread than after administration of 1/10 LD<sub>50</sub>. Intoxication with maneb after a single inhalation exposure (700 mg/m<sup>3</sup>) induced pronounced structural changes in the organs of experimental animals. Multiple inhalation exposure to maneb at the threshold concentration (4.7 mg/m<sup>3</sup>) for 4 months caused venous congestion and small foci of interstitial tissue proliferation in parenchymatous and endocrine organs.

"Endurance Investigation of the Alloy D16AM0 by Acoustic  
Loading"

Kiyev, Problemy Prochnosti, No 9, Sep 71, pp 116 --120

Abstract : Investigation results are presented of the endurance of 0.8 mm-thick specimens of the alloy D16AM0 by harmonic loading on an electrodynamic vibration stand and on a special unit where the specimens were subjected to the effect of narrow-band and broad-band high-intensity noise of a siren. The highest value of the endurance limit was found by harmonic loading, the lowest by broad-band acoustic loading. The longevity was calculated by the methods of linear and spectral summations of fatigue damages by all loading conditions. A satisfactory coincidence was found between the experimentally determined and the calculated longevities by the two methods. Twelve formulas, six illustr., five biblio. refs.

ABSTRACT. THE AUTHOR COMPARES THE KNOWN ABSOLUTE TEMPERATURES OF THE UPPER LAYERS OF THE EARTH'S EXOSPHERE (T SUBE) AND THE SUN'S OUTER CORONA (T SUBC) WITH THE CORRESPONDING VALUES OF THE GRAVITATIONAL POTENTIALS U SUBE AND U SUBC; CELESTIAL BODY SUN: TEMPERATURE OF CORONA AND EXOSPHERE EQUALS 2 TIMES 10 PRIME6; U, CM PRIME2 PLUS SEC PRIME2 EQUALS 6.3 TIMES 10 PRIME14; 3-2KT-M SUBH U EQUALS 0.40; CELESTIAL BODY EARTH: TEMPERATURE OF CORONA AND EXOSPHERE EQUALS 1.5 TIMES 10 PRIME3; U, CM PRIME2 PLUS SEC PRIME2 EQUALS 5.6 TIMES 10 PRIME11; 3-2KT-M SUBH U EQUALS 0.34. M, SUBH IS THE MASS OF A HYDROGEN ATOM (PROTON). THE ALTITUDES USED IN THESE DETERMINATIONS WERE APPROXIMATELY 800 KM FOR THE EARTH AND ABOUT 1.4 TIMES 10 PRIME6 KM FOR THE SUN. IT HAS BEEN DEMONSTRATED THAT THE UPPER LIMIT OF POSSIBLE TEMPERATURES OF THE OUTER ATMOSPHERES OF MANY STARS IS DETERMINED BY THEIR GRAVITATIONAL POTENTIAL. THE EXOSPHERES OF THE EARTH AND SUN HAVE LIMITING TEMPERATURES; WITHIN THEM THE STATE OF DISSIPATION OCCURS FOR PARTICLES WITH THE MASS OF A HYDROGEN ATOM. NEITHER THE RADICAL DIFFERENCES IN THE MAGNETIC FIELDS OF THE EARTH AND SUN NOR THE COMPOSITION AND DEGREE OF IONIZATION OF THE PARTICLES IN THEIR EXOSPHERES NOR OTHER DIFFERENT CONDITIONS IMPAIR THE DECISIVE EFFECT EXERTED ON THE TEMPERATURES OF THE TERRESTRIAL AND SOLAR EXOSPHERES BY THE GRAVITATIONAL FIELDS OF THESE CELESTIAL BODIES.

ABSTRACT/EXTRACT--THIS, AS WELL AS THE FACT THAT THE INTERPLANETARY GAS CONSISTS FOR THE MOST PART OF HYDROGEN (ATOMIC AND IONIZED) IN THE NEIGHBORHOOD OF THE ORBITS OF OTHER PLANETS (EXCEPT THE EARTH) SUGGESTS THAT THE RATIO OF  $3-2kT-m$  SUBH  $\bar{U}$  DIFFERS LITTLE FROM ITS VALUES FOR THE EARTH AND SUN IN THE EXOSPHERES OF MERCURY, VENUS, MARS, AND JUPITER AND THERE THE MEAN KINETIC ENERGY OF THE PARTICLES POPULATING THE EXOSPHERE IS CLOSE TO THE KINETIC ENERGY OF A HYDROGEN ATOM (PROTON), HAVING FIRST COSMIC VELOCITY FOR THESE PLANETS. THE TEMPERATURES OF THE EXOSPHERES OF MERCURY, VENUS, MARS, AND JUPITER CAN BE ESTIMATED AS FOLLOWS (IN DEGREE SK): 400, 800, 300, 25,000. WITH RESPECT TO THE EXTENT OF THE UPPER EXOSPHERES, ALL OTHER CONDITIONS BEING EQUAL, IT IS PROPORTIONAL TO THE RATIO OF THE TEMPERATURE  $T$  TO MASS  $M$ .

"Heat-Transfer Crisis in the Case of Boiling of Binary Mixtures Under Conditions of Forced Motion"

V sb. Teplo- i massopereenos. T. 2. Ch. 1 (Heat Transfer and Mass Transfer, Vol 2, Part 1--collection of works), Minsk, 1972, pp 62-66 (from RZh-Mekhanika, No 9, Sep 72, Abstract No 9B990)

Translation: The paper presents the results of experiments on the crisis when binary mixtures are boiled in tubes: alcohol - water, acetone - water, alcohol - benzene, ethylene glycol - water. The experiments were done in the following ranges of parameter variation: pressure  $P = 3.3-13.2$  bars, rate of circulation  $W = 2.5-10$  m/s, underheating  $\Delta t_{\text{u}} = 10-110^{\circ}\text{C}$ , concentration  $C = 0-100\%$ . Heat release was done on a tube with inside diameter of  $d = 6$  mm and length  $l = 60$  mm. It was noted that an increase in underheating and velocity raises the critical thermal load  $q_{\text{cr}}$ , the effect of underheating being nearly linear, and increasing with an increase in velocity. With an increase in the length of the tube,  $q_{\text{cr}}$  falls, but changes little beginning with  $l/d > 10-12$ . The effect of pressure in the investigated region was in-

significant. In mixtures with azetron [sic] the dependence of  $q_{cr}$  on concentration has maxima coinciding with the maxima of excess content of the high-volatility component in the vapor as compared with the liquid. The increase in  $q_{cr}$  is attributed to the reduction in the detachment diameters of bubbles, their average rate of growth, and the number of vapor-generating centers. All this reduces the vapor content of the wall layer.

Another reason for increase of  $q_{cr}$  is assumed to be the rise in the gradient of surface tension on the phase interface. Due to the "Marangoni effect", these increased gradients prevent the merging of vapor bubbles and the formation of a stable vapor film. In mixtures without an azeotrope, the dependence of  $q_{cr}$  on concentration is monotonic, without maxima, which is due to the fact that there is no reduction in the detachment diameters of vapor bubbles and their rate of formation in this case. A dimensional computational formula which generalizes the results of the experiments to an accuracy of  $\pm 20\%$  is proposed. Yu. Ye. Pokhvalov.

"Synthesis of an Antenna Array of Slot Radiators With Passive Elements"

Moscow, Radiotekhnika i Elektronika, Vol 16, No 7, Jul 71, pp 1133-1143

Abstract: A solution is found for the problem of synthesizing an antenna array of slot radiators which contains passive elements. It is assumed that the radiation pattern and geometry of the radiating system are given. Interaction of the radiators due to the external electromagnetic field is taken into consideration. The method of solution can be used to find the minimum number of active radiators in the system. An antenna system made up of  $N$  narrow slots cut in a closed ideally conducting surface  $S$  is considered. Some of the slots may be passive re-radiators. The active elements of the array are excited by independent sources. Their amplitude-phase distribution is calculated from the condition of the best approximation on the average to the given radiation pattern. Radiators are found from among those given which would make effective passive elements of the array, as well as the pure susceptance of the cavities of these radiators.

236489

AIR HUMIDIFIER comprises body connected by pipelines to a topping-up connection, tubular evaporating elements, an air duct formed by the inter-tube space and diffusors, and a ventilator set in a diffusor, having in its body levelling valves and compensatory elements in the form of rubber bulbs, within which are tubes with apertures on the surface. The working cavities of the body and the tubular evaporating elements are filled with hygroscopic material of wick type. On the topping-up connection is a removable filter filled with ion-exchange resins. This enables the device to work independently from a high pressure source. Air from the cabin is sucked up by the ventilator and goes via the diffusor into the inter-tube space, where it passes round the tubular evaporating elements, through the pores of which water is constantly evaporated into the air flow. From the inter-tube space the humidified air is ejected into the cabin. The evaporation of water from the pores of the tubular evaporating elements is due

3

19820250

to the psychometric temperature difference. The rate of evaporation of the water automatically increases or decreases as the humidity of the incoming air decreases or increases, i.e. the cabin air is kept properly humidified without automation equipment. The device is applicable to air conditioning systems of aircraft.

COMPLEX INVESTIGATION OF PSYCHIC STATES OF MAN IN INDIVIDUAL AND GROUP ACTIVITY

JPRS 00492  
9 November 1973

Directed by M. A. MATOVA, Scientific Research Institute of General and Pedagogical Psychology of the USSR Academy of Sciences, CHISTENSKIY MONASTYR, MOSCOW, YANOVSKY PULKOVOYI, MARIEN, 15  
4, 1973, pp 42-52

Psychic states are manifested most clearly, and, therefore, can be studied most objectively in the process of individual and group activity of man. Here, the so-called "difficult" or "extreme" conditions of human activity act as "catalyzers." Such conditions are: deficiency of time, various interferences, necessity of performing two or more functions simultaneously, conflicting situations developing in a group in performing a common task, and others. The "indicators" of psychic states are the changes in the behavior of man, both manifested externally and hidden, as well as the peculiarities of his activity.

The problem of comprehensive investigation of psychic states of man under varying conditions of his activity can be solved only in a complex experimental study with the application of a combination of methods and experimental means.

Consequently, the present study has been done with the application of complex methods developed in recent years in the laboratory of psychic states: "laboratory" method [4], "group digital test" [5], as well as the "homeostatic method" and the "noise-resistance test" which have been sufficiently appreciated in aviation and space psychology.

Selection of these methods was determined by their model nature and common principles of organization and approaches.

\*Materials of this study were reported in a brief form at the 4th All-Union Congress of the USSR Psychology Association in Tallin (1971).

Translation: The protective action of sodium hydroxybutyrate (I) was studied on mice using subcutaneous or intraperitoneal administration, 25 minutes prior to exposure to lethal doses of organophosphorus compounds. In preliminary experiments concentrations of I were determined (100 and 200 mg/kg) which exhibit marked protective action. It has been shown that subcutaneous administration of 100 and 200 mg/kg of I resulted in 65 and 85% survival of the animals respectively. It has been assumed that the expressed protective action of I (especially on subcutaneous injection) is connected with an action on the retarding CNS paths and not with the blocking of the choline receptors nor with the action of nucleophilic substances -- reactivators of CE.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. ANALYSIS OF DIFFERENT EXISTING DEFINITIONS OF THE DAMPING CHARACTERISTICS (ABSORPTION COEFFICIENT) OF DISSIPATIVE SYSTEMS. A DISCREPANCY IS REVEALED BETWEEN THE VALUES OF CHARACTERISTICS DETERMINED FROM THE DAMPING OF THE NATURAL VIBRATIONS OF A SYSTEM WITH AN AMPLITUDE DEPENDENT RESISTANCE AND THE VALUE OF THE ENERGY DISSIPATION CHARACTERISTIC FOR STEADY STATE VIBRATIONS. IT IS SHOWN THAT THIS DISCREPANCY SHOULD BE ATTRIBUTED TO THE NATURE OF THE DISSIPATIVE FORCES AND TO THE METHOD BY WHICH THEY ARE DETERMINED. A DEFINITION OF THE AUTHENTIC VALUE OF THE ENERGY DISSIPATION CHARACTERISTIC OF A SYSTEM DETERMINED FROM THE DAMPING OF ITS NATURAL VIBRATIONS IS PROPOSED. FACILITY: AKADEMIIA NAUK UKRAINSKOI SSR, INSTITUT PROBLEM PROCHNOSTI, KIEV, UKRAINIAN SSR.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A KINETIC MODEL, WHICH ADEQUATELY DESCRIBED THE DEHYDRATION OF ME SUB2 C(OH)CO SUB2 H TO CH SUB2:CHCO SUB2 H OVER A CA SUB3(PO SUB4)SUB2 CATALYST, IS DEVELOPED BY TREATING EXPTL. DATA ANAL. THE MODEL IS DESCRIBED IN TERMS OF 3 INTEGRAL EQUATIONS AND ACCOUNTS WELL FOR THE DECREASE IN CATALYST REACTIVITY AS A FUNCTION OF TIME.
